

TensorResNet

April 13, 2022

1 CS3244 Project: ResNet50 implementation to study leaf disease

Run the code below to make sure that your environment is correctly set up before continuing running the main section below

```
[ ]: import sys
import os
import tensorflow.keras
import pandas as pd
import sklearn as sk
import tensorflow as tf
import seaborn as sn

print(f"Tensor Flow Version: {tf.__version__}")
print(f"Keras Version: {tensorflow.keras.__version__}")
print()
print(f"Python {sys.version}")
print(f"Pandas {pd.__version__}")
print(f"Scikit-Learn {sk.__version__}")
print(f"Seaborn {sn.__version__}")
gpu = len(tf.config.list_physical_devices('GPU'))>0
print("GPU is", "available" if gpu else "NOT AVAILABLE")
```

Init Plugin

Init Graph Optimizer

Init Kernel

Tensor Flow Version: 2.5.0

Keras Version: 2.5.0

Python 3.9.12 | packaged by conda-forge | (main, Mar 24 2022, 23:24:38)

[Clang 12.0.1]

Pandas 1.4.2

Scikit-Learn 1.0.2

Seaborn 0.11.2

GPU is available

1.1 Implementation set up

Import necessary library and methods

```
[ ]: from tensorflow.keras.layers import Flatten, Dense, GlobalAveragePooling2D
from tensorflow.keras.applications.resnet50 import preprocess_input
from tensorflow.keras.preprocessing.image import ImageDataGenerator
from tensorflow.keras.preprocessing import image_dataset_from_directory
from tensorflow.keras.applications.resnet50 import ResNet50
from tensorflow.keras.models import Sequential, Model, load_model
from tensorflow.keras.optimizers import Adam
import matplotlib.pyplot as plt
import numpy as np
```

The data is taken from Kaggle open data set [New Plant Diseases Dataset](#). The data has been filtered and for this project the focus is only on Corn, Potato and Tomato because they are staple food and vegetable. This is so it is inline with the mission of the project which is detecting of disease plants in vertical farm.

The parameters of the image data we use is as follow: - Dimension: 256x256 - Colour space: RGB - Alpha channel: no

So there are a total of 3 channels for the image (corresponding to Red, Green, Blue)

The *_dir variable refer to the directory where the train data is at and where the test data is at.

The validation data from the dataset is being used as a test set because the original test data is not sufficient. We split the training set into a training set and a validation set using Keras API as shown in the code later on.

```
[ ]: IMG_HEIGHT, IMG_WIDTH = (256, 256)
BATCH_SIZE = 64

train_data_dir = r"archive/data/train"
test_data_dir = r"archive/data/test"

train_corn_dir = os.path.join(train_data_dir, 'corn')
train_potato_dir = os.path.join(train_data_dir, 'potato')
train_tomato_dir = os.path.join(train_data_dir, 'tomato')

test_corn_dir = os.path.join(test_data_dir, 'corn')
test_potato_dir = os.path.join(test_data_dir, 'potato')
test_tomato_dir = os.path.join(test_data_dir, 'tomato')
```

To get a rough number of how many images are in each file we create a small get_number function.

```
[ ]: def get_number(directory):
    count = 0

    for folder in os.listdir(directory):
        if folder.startswith('.'):
            continue
        tmp = os.path.join(directory, folder)
        count += len(os.listdir(tmp))
```

```

return count

print(f"{len(os.listdir(train_corn_dir))-1} classes with_
↳{get_number(train_corn_dir)} images in training corn folder")
print(f"{len(os.listdir(train_potato_dir))-1} classes with_
↳{get_number(train_potato_dir)} images in training potato folder")
print(f"{len(os.listdir(train_tomato_dir))-1} classes with_
↳{get_number(train_tomato_dir)} images in training tomato folder")
print('\n')
print(f"{len(os.listdir(test_corn_dir))-1} classes with_
↳{get_number(test_corn_dir)} images in testing corn folder")
print(f"{len(os.listdir(test_potato_dir))-1} classes with_
↳{get_number(test_potato_dir)} images in testing potato folder")
print(f"{len(os.listdir(test_tomato_dir))-1} classes with_
↳{get_number(test_tomato_dir)} images in testing tomato folder")

```

4 classes with 7316 images in training corn folder
3 classes with 5702 images in training potato folder
10 classes with 18345 images in training tomato folder

4 classes with 1829 images in testing corn folder
3 classes with 1426 images in testing potato folder
10 classes with 4586 images in testing tomato folder

From the number we can see that the dataset has sufficient images. To save on both runtime and computational power, we choose an EPOCHS of 20 which will yield roughly 100 images per batch (or a batch size of 100).

```
[ ]: EPOCHS = 10
```

Here we use Keras API to clean and regenerate the dataset for us so that we can use them for training and testing.

```

[ ]: train_datagen = ImageDataGenerator(
    preprocessing_function=preprocess_input,
    shear_range=0.2,
    zoom_range=0.2,
    horizontal_flip=True,
    validation_split=0.2, #reserving 20% of the data for validation
)

def create_generator(ls):
    train = train_datagen.flow_from_directory(
        directory=ls,
        target_size=(IMG_HEIGHT, IMG_WIDTH),
        batch_size=BATCH_SIZE,

```

```

        seed=17, #for reproducibility
        class_mode='categorical',
        subset='training'
    )
